To attain the highest speed a wagon should follow the horse in a direct line. This can only be accomplished by the wheels running plumb: any inclination in the axle to apread destroys the plumb of the spoke and gives a lateral motion to the wheel, causing it to push out sideways. This lateral movement greatly increases the friction to be overcome by the horse, with a consequent waste of power, thus detracting from his speed in direct proportion to the spread of the axle.

With our Vertical Steel Plates we have benn enabled to build wagons of the lightest weight, running so absolutely true that we have yet to hear the first complaint from our patrous.
